

It is possible to work the last stitch of the forward pass in the same way as the other stitches in the row, and for some projects this is perfectly acceptable. However, with projects that need a cleanly-defined edge similar to the starting edge of the fabric, it is preferable to work the last stitch of the forward pass in a specific location. If you choose to work the last stitch of the forward pass in its own specific location, it should be consistently worked this way throughout the project, regardless of what stitch is being used within a particular row.

Identify the last front vertical bar of the row. Tunisian crochet fabric has a tendency to droop downwards and it is an easy mistake to skip the last stitch. If you follow the last stitch of the row up from the bottom of the work, you may find it easier to identify the last vertical bar of the row.

Now identify the lower horizontal bar of this last stitch.

An easy way to identify this part of the stitch is to follow the last front vertical bar thread down through where it works into the stitch below and then up again into the lower horizontal bar of the stitch.

You can check that you are inserting your hook into the right position by checking the edge of the fabric defined by this stitch. It should form a series of interlocking loops as pictured.
